

Brainstorm & Idea Prioritization

Ideation Phase

Date	2 Oct 2025
Team ID	SWTID-2026-5846
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	4 Marks

Purpose

The brainstorming activity was used to create an open space for the team to identify the school IT helpdesk problem, generate multiple possible solution ideas, group related ideas, and prioritize the concepts based on their importance and feasibility.

Step 1: Team Gathering, Collaboration and Problem Selection

The team discussed common school IT helpdesk requests such as Wi-Fi connectivity issues, projector failures, password or login problems, and slow computers. The discussion identified manual ticket review and classification as a recurring operational problem. IT staff currently need to inspect incoming requests and determine the appropriate category and subcategory before the ticket can be handled efficiently.

Selected Problem Statement

School IT support tickets are manually reviewed and categorized by IT staff, making ticket classification time-consuming and increasing the possibility of inconsistent categorization.

Step 2: Brainstorm, Idea Listing and Grouping

The team generated multiple solution concepts before selecting the final implementation. The ideas were grouped according to their main purpose.

Idea Group	Ideas Generated	Purpose
Ticket Management	Centralized IT ticket management; structured ticket records	Organize and standardize incoming support requests.
Automation	Rule-based ticket classification; Flow Designer classification; automated email notification	Reduce manual classification and improve consistency.
ServiceNow Configuration	Custom ticket table; Category/Subcategory choices; dependent choice logic	Provide structured and controlled ticket data.
Advanced Solutions	Machine-learning classification; AI chatbot; predictive ticket routing	Explore more advanced approaches for future enhancement.

Grouped Brainstorming Outcome

- Manual / structured ticket management
- Rule-based classification and workflow automation
- ServiceNow-based ticket configuration

- Advanced AI or machine-learning approaches

Step 3: Idea Prioritization

The generated ideas were considered using two dimensions represented in the supplied template: importance to the identified problem and feasibility of implementation.

Idea	Importance	Feasibility
Manual ticket management	Medium	High
Centralized ticket management	High	High
Rule-based ticket classification	High	High
Flow Designer-based classification	High	High
Automated email notification	Medium	High
Machine-learning classification	High	Medium / Requires additional development
AI chatbot for IT support	Medium / High	Medium / Requires additional development
Predictive ticket routing	Medium	Low / Requires additional development

Selected Concept

Auto Ticket Classification using Flow Designer

The team selected this concept because it directly addresses the identified manual classification problem using a no-code automation approach. The intended solution automatically assigns Category and Subcategory based on predefined keywords and provides an automated confirmation to the caller.

Ideation Outcome

The brainstorming activity resulted in a clearly defined automation concept for the school IT helpdesk. The selected concept became the basis for the subsequent requirement analysis, system design, implementation, and testing phases.
