

Solution Requirements (Functional & Non-functional)

Auto Ticket Classification using Flow Designer

Date	2 oct 2026
Team ID	SWTID-2026-5846
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	4 Marks

1. Functional Requirements

The functional requirements describe what the completed ServiceNow solution must do. They are derived from the actual project workflow rather than from generic helpdesk features.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	Ticket Creation	Create an IT support ticket with Caller and Short Description information.
FR-2	Automatic Classification	Automatically classify a newly created ticket by evaluating the Short Description in Flow Designer.
FR-3	Category and Subcategory Assignment	Assign the appropriate Category and Subcategory based on the classification rule.
FR-4	Dependent Choice Logic	Keep Subcategory values dependent on the selected Category.
FR-5	Email Notification	Send a confirmation email to the caller after ticket creation/classification.
FR-6	Structured Ticket Storage	Store ticket number, caller, classification, description, state and assignment-related fields in the custom table.
FR-7	Update Set Management	Capture project configuration in the Project Update Set so the completed configuration can be exported.

2. Classification Rules

Input Keyword / Issue	Category	Subcategory
WiFi / Wi-Fi	Network	Wi-Fi
Projector	Hardware	Projector
Password / Login	Access	Forgot Password
Slow / Hanging	Performance	Slow Computer

The classification is rule-based. It does not use a machine-learning model in the current implementation.

3. Non-functional Requirements

NFR No.	Non-Functional Requirement	Description
---------	----------------------------	-------------

NFR-1	Usability	The ticket form should allow the user to provide the necessary request information without requiring manual classification of the final Category and Subcategory.
NFR-2	Security	Access to the ServiceNow application and its records is governed by the permissions and access controls of the ServiceNow instance. The project should not expose ticket information outside authorized access.
NFR-3	Reliability	The same predefined keyword rule should produce the same Category and Subcategory for a matching ticket, making classification consistent.
NFR-4	Performance	The flow uses lightweight keyword-based conditions and record updates. No performance benchmark is claimed unless measured separately.
NFR-5	Availability	The solution runs inside the ServiceNow instance, so availability depends on the availability of that ServiceNow environment.
NFR-6	Scalability	Additional issue types can be added by extending the Flow Designer conditions and corresponding choice values without redesigning the whole solution.

4. Requirement Boundaries

The current implementation focuses on automatic classification and caller notification. Advanced machine-learning classification, external integrations, predictive analytics, and automatic assignment to support groups are outside the current implementation unless they are added and tested separately.
