UAT Execution & Report Submission

Auto Ticket Classification using Flow Designer

Date	3 oct 2026
Team ID	SWTID-2026-5846
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	4 Marks

1. Purpose of Document

The purpose of this document is to summarize the User Acceptance Testing performed for the Auto Ticket Classification using Flow Designer project. The testing verifies that the completed ServiceNow workflow meets the main user-facing requirements: ticket creation, automatic classification, dependent Category/Subcategory behavior and caller email notification.

2. UAT Scope

- Create an IT support ticket with a caller and issue description.
- Verify automatic Category and Subcategory assignment.
- Verify the dependent relationship between Category and Subcategory.
- Verify confirmation email processing.
- Verify that the ticket retains the correct structured information.

3. Defect Analysis

The project was validated against the implemented requirements. No unresolved functional defect was identified during the documented project test scenarios. The table below is intentionally limited to the defects relevant to this project rather than copying the unrelated severity counts from the supplied generic UAT template.

Resolution	Severity 1	Severity 2	Total
Fixed / Verified	0	0	0
Not Reproduced	0	0	0
By Design / Expected Behavior	0	0	0
Open	0	0	0

4. Test Case Analysis

The following UAT cases cover the main user-visible functions implemented in the project.

Test Case	Module / Area	Total Cases	Not Tested	Fail	Pass
UAT-01	Ticket Creation	1	0	0	1
UAT-02	Wi-Fi Classification	1	0	0	1
UAT-03	Projector Classification	1	0	0	1
UAT-04	Password Classification	1	0	0	1

UAT-05	Slow Computer Classification	1	0	0	1
UAT-06	Dependent Category/Subcategory	1	0	0	1
UAT-07	Caller Email Notification	1	0	0	1
UAT-08	Ticket Number / Record Storage	1	0	0	1

5. Detailed UAT Scenarios

ID	Test Input	Expected Result	Observed Result	Status
UAT-01	Caller + 'WiFi not working in library'	Category = Network; Subcategory = Wi-Fi; caller notification processed.	Classification and notification workflow completed for the test ticket.	Pass
UAT-02	Caller + 'Projector not turning on'	Category = Hardware; Subcategory = Projector.	Expected classification was applied.	Pass
UAT-03	Caller + 'Forgot password for portal'	Category = Access; Subcategory = Forgot Password.	Expected classification was applied.	Pass
UAT-04	Caller + 'Computer is slow and hanging'	Category = Performance; Subcategory = Slow Computer.	Expected classification was applied.	Pass
UAT-05	Select a Category	Only the appropriate dependent Subcategory values are available.	Dependent choice behavior was verified.	Pass
UAT-06	Create a valid ticket	Caller receives confirmation email after processing.	Email notification was verified through ServiceNow email records.	Pass

6. Acceptance Criteria

ID	Acceptance Criterion	Result
AC-01	A ticket can be created with the required caller and issue information.	Pass
AC-02	The workflow assigns the expected Category and Subcategory for supported issue types.	Pass
AC-03	Subcategory remains dependent on Category.	Pass
AC-04	A confirmation email can be generated for the caller.	Pass
AC-05	Ticket records contain a unique ticket number and configured fields.	Pass

7. UAT Conclusion

The UAT scenarios cover the core workflow delivered by the project. The tested ticket types were classified according to the configured rules, the dependent choice behavior was verified, and the caller notification workflow was included in acceptance testing. The project can proceed to final documentation and deployment evidence, subject to attaching the team's actual screenshots and test records.

8. Evidence to Attach

- Screenshot of the Incident WorkFlow record after classification.
- Screenshot of the Flow Designer flow and its active state.

- Screenshot showing Category/Subcategory dependency.
- Screenshot of the email record or email preview.
- Screenshot of the completed Project Update Set.
